## VIBRATORY TUMBLE MEDIA

### About:

#### **High Density Ceramic Media, Plastic Media, Synthetic Media, and Millimeter Size Media**

In the tumbling process, a preformed media is the rigid agent that abrades the given part and removes the unwanted material. The advantage of this media is the inclusion of a bonding agent that continuously recedes and exposes more abrasive particles. In result, they maintain a relatively consistent removal rate over at least have the size of its shape. Your desired surface finish determines the needed characteristics of your chosen media, such as size, shape, internal particle size, and mineral composition.

### Typical Applications:

**High Density Ceramic Media:** For general purpose, polishing, light and heavy deburring, fast and extra fast deburring and ultra-aggressive metal removal

**Ceramic Media:** For general purpose, polishing, light and heavy deburring, fast and extra fast deburring and ultra-aggressive metal removal

**Plastic Media:** For general metal removal, prepaint or preplate surface finishing and polishing, fast and heavy cutting

**Synthetic Media:** For general metal removal, prepaint or preplate finishing, polishing, fast and heavy cutting

**Millimeter Size Media:** For polishing, light deburring and fast-cut applications
